

# Operation Chaos Shifts into Overdrive

*by Miles Mathis*

*First published May 25, 2025*

All Google-type searches had gone to shite years ago, but somehow they just got worse. Finding any information on the internet is now almost impossible, and I don't just mean political info or non-fake news. I showed you last week that Youtube is now pushing fake news items, simply reporting things that aren't true. Also making up historical items just for fun. I guess this is AI hallucinating or something, but they should really rein it in: I don't see how this is selling people on AI. Just the opposite because we are all quickly coming to the conclusion AI doesn't know reality from a hole in the ground.

The same thing is happening to searches, since they seem to be all led by these AI hallucinations now, even on the most basic things. For example, I was looking up glove sizing today and all the results on the front page were worthless. [They were AI entries](#), with the computer rattling on and on for pages, making up fake histories of glove making, a list of reasons you might need a glove, materials, weather conditions, and on and on. Everything *except* answering the question you just asked. Here is an example:

## **What Is A Cadet Medium Golf Glove**

**A regular medium golf glove fits those with a middle finger length of 4 to 5-inches and a palm width of 2 to 7 inches. A cadet medium fits those with a middle finger length of 3 to 4-inches, along with a 5 to 6-inch palm width.**

What? None of that is close to correct, and doesn't even make sense. So I tried to walk around AI answers by going directly to images of sizing charts. Nope, that didn't work either, since all the charts were apparently made by AI as well: none of them match and they are all wrong.

# **GLOVES SIZING CHART**

## MEN / WOMEN

To determine your glove size use a measuring tape. Loosely wrap the measuring tape around your upper palm without the thumb.

SIZE	MEN	WOMEN
XS	Size Not Available	5 7/8
S	6 11/16 - 7 1/2	6 11/16
M	7 7/8 - 8 1/4	7 1/16
L	8 11/16 - 9 1/16	7 1/2
XL	9 7/16 - 9 13/16	7 7/8
2XL	10 1/4 - 10 5/8	8 1/4
3XL	11	Size Not Available

NOTE: This chart is only an approximate size, gloves should be tried on to confirm best fit.

That's the first one that comes up, but it is wrong. I measure 8.75 inches and am a medium, but this says I am a large. Also notice that it has huge gaps, with no result for 8.5 inches or 9.25 inches or 10 inches. I checked dozens of other charts and they were also wrong.

I also find it curious that AI illustrates a human hand with a very short life line and head line. That person would have an IQ of about 70 and wouldn't live to 40. Coincidence?

This isn't rocket science, so I don't know what is going on. I honestly don't think it is just a temporary glitch, some sort of learning curve for AI. This is the worst possible advertising for AI, since there is no chance people are going to buy an AI that is wrong about everything, down to what time it is and how many inches are in a foot. If you grab AI to help you with your homework and it gives you the wrong answers for everything, you are going to get a F and not be very happy. That is unless AI is grading the paper as well. In which case you are golden. The professor-bot will love your answer that Isaac Newton lived in Harlem in the 1950s, working with the Al Jolson singers.

Yes, I think this is being done on purpose, as a natural continuation of Operation Chaos. We know they want you as stupid as possible, so what better way to achieve that than to have you tutored on the internet by a retarded AI?

Do you trust an AI that can't get glove sizing correct to be driving big rigs on the nation's highways?

How this will affect pub quizzes is yet to be seen. Those cheating under the table (at least half the people in the room, in my experience\*) won't be able to find correct answers anymore. But neither will the host, giving us a double negative. Your only hope will be to guess what incorrect answer the host found at Wikipedia, [like in that old SNL skit with Steve Martin](#).

\*A person on my team got bumped because we were over the number, so he had to play with a competing team, who was a player short. He came back to us after the quiz with some interesting info: that team had been looking everything up on their phones under the table. Shocking, right? Uh no, it is par for the course these days.
